

## Chapter

# Occurrence of Dog Bites and Rabies within Humans in Srinagar, Kashmir

*Namera Thahaby, Afzal Hoque Akand, Abdul Hai Bhat, Shabeer Ahmed Hamdani and Mudasir Ali Rather*

## Abstract

Open garbage dumps and dog bites are major public health problems in the Kashmir region. In Srinagar city, there are more than 91,000 dogs, or about one dog for every 12 citizens. The mounting street dog population is leading to increasing fright in the city due to the fear of rabies. Although treatable, rabies can be deadly without access to vaccines and treatment. Unfortunately, Kashmir is experiencing a shortage of the anti-rabies vaccine. More than 80,000 dog bites and 20 deaths due to rabies were reported in the Kashmir valley in the period 2008–2012. We conducted our study of dog bites in Srinagar, which has a large stray dog population, perhaps due to mismanagement of garbage. We obtained our data from Shri Maharaja Hari Singh (SMHS) Hospital. We found that most dog bite victims were males aged 30–40 years presenting with category 3 bites to the legs. The majority of victims were bitten in the evening and reported to the hospital the same day. Most victims received immunoglobulin treatment. We suggest that proper garbage control can help to curb the stray dog population in the area and thus reduce the incidence of rabies.

**Keywords:** rabies, dog bites, Srinagar, Kashmir

## 1. Introduction

Open garbage dumps and dog bites are major public health problems in the Kashmir region. In Srinagar city, there are more than 91,000 dogs [1], or about one dog for every 12 citizens. More than 80,000 dog bites and 20 deaths due to rabies were reported in the Kashmir valley in the period 2008–2012 [2]. The area's Anti-Rabies Clinic (ARC), Shri Maharaja Hari Singh (SMHS) Hospital, depleted its stock of vaccine fourfold in a ten-month period [3]. The overwhelming majority of dog bite cases (9514) occurred in Srinagar [4]. Of these cases, 80% occurred in urban spaces and 20% occurred in rural areas.

## 2. Research methodology

The present study was conducted in the Srinagar district in Kashmir, which has a large stray dog population, perhaps due to mismanagement of garbage. We obtained data on dog bites and victims from SMHS.

**Table 1.**  
*Srinagar Municipal Corporation zones and wards.*

We categorized the incidents into zones as per the Srinagar Municipal Corporation, as shown in **Table 1**. This was done to determine which zone recorded the greatest number of cases.

### 3. Results

**Table 2** shows the distribution of dog bite victims according to gender and zones (**Figure 1**). Overwhelmingly, the majority of victims in each zone are male. In the east zone, 82.23% of victims were males and 17.76% of victims were females. In the west zone, 71.90%, of victims were males and 28.09% of victims were females. In the north

| Gender | Zones       |             |             |             |
|--------|-------------|-------------|-------------|-------------|
|        | East        | West        | North       | South       |
| Male   | 162 (82.23) | 238 (71.90) | 213 (72.94) | 236 (73.06) |
| Female | 35 (17.76)  | 93 (28.09)  | 79 (27.05)  | 87 (26.93)  |
| Pooled | 197         | 331         | 292         | 323         |

$$\chi^2 = 8.023, p = 0.045$$

*Figures in parentheses indicate percentage.*

*\*indicates difference at 5% level of significance.*

**Figure 1.**  
 Distribution of dog bite victims according to gender and zone.

zone, 75.94% of victims were males and 27.05% of victims were females. In the south zone, 73.06% of victims were males and 26.93% of victims were females. Statistically, there is a nonsignificant difference concerning gender for different zones. **Table 3** shows the distribution of victim age according to zones. In the east zone, 24.87% of victims were aged 30–40 years, 19.28% of victims were aged 20–30 years, 14.72% were aged 10–20 years, 12.89% were aged 40–50 years, 12.69% were aged 1–10 years, 9.64% were aged 50–60 years, and the remaining 6.59% of victims were aged 60 years and older.

The same pattern was observed for the west, north, and south zones. Statistically, there is a nonsignificant difference concerning age for different zones. **Table 4** shows the date of reporting according to different zones. In the east zone, 67.51% of victims reported on the same day, 25.88% reported after a day or more, and the remaining 6.59% reported after a week. The same pattern was observed among the other zones. Statistically, there was a nonsignificant difference concerning the date of reporting for different zones. **Table 5** depicts the distribution of victims according to the time of

**Table 9.**  
 Distribution of dog bite victims who received immunoglobulin treatment according to zone.

zones. Statistically, there was a nonsignificant difference concerning the time of exposure for different zones. **Table 6** depicts victims according to the time of reporting for different zones. In the east zone, 42.63% victims reported in the evening, 36.54% reported in the morning, 14.21% reported in the daytime, and 6.59% reported in the nighttime. **Table 7** depicts victims according to the site of the bite. In the east zone, 63.45% of victims had bites on the legs, 13.19% had bites on the hands, arms, and shoulders, 7.01% had bites on the buttocks, 13.19% had bites on the knees and thighs, 1.01% had bites on the face, and 2.03% had bites on the abdomen and back. Likewise, the other zones showed a similar trend. Statistically, there was a nonsignificant difference concerning the site of bite for different zones (**Figure 2**). **Table 8** depicts victims according to the category of bite. In the east zone, 76.14% of victims had category 3 bites, while 23.85% had category 2 bites. A similar pattern was observed for the other zones. **Table 9** depicts victims according to those who received immunoglobulin treatment. In the east zone, 87.30% of victims received immunoglobulin, while 12.69% did not. The other zones showed a similar distribution. Statistically, there was a nonsignificant difference in receiving immunoglobulin for different zones.

#### 4. Discussion

Rabies is a deadly disease if not treated promptly and properly. In our study, we collected data on dog bite victims and patterns in different zones in Srinagar, Kashmir. We found that males were bitten more than females, which is likely due to the fact that men in the area venture out of their homes to go to work more often than the women do. Most victims are 30 to 40 years old, which conforms with the findings of Mohammadzadeh et al. [5] and Agarvval and Reddaiah [6]. Due to fear of rabies, most victims reported to the hospital on the same day they were bitten. The highest number of cases was seen in the evening when people usually return from work and school. The site of the bite is important, as the rabies virus has broad tissue tropism. The majority of dog bites were to the legs, which other studies by Ain et al. [4], Acharya et al. [7], Chopra et al. [8], and Agarvval and Reddaiah [6] have also confirmed. When a dog threatens a person, it typically bites the lower extremities. Conversely, when a person threatens a dog, the dog is more prone to biting the upper extremities. Although only some of the bites were to the face and head, we observed that children aged younger than 10 years were more prone to being bitten on the head compared to older victims. Typically, children display offensive acts toward dogs, and the head of a

child is closer to the mouth of a dog. Most of the bites were category 3, which means the bites penetrated the skin and caused deep wounds. Victims of category 3 bites received immunoglobulin treatment. The west zone of the city experienced the greatest number of dog bite incidents. This might be because the area is crowded and has many open garbage dumps, which attract stray dogs and increase the risk of rabies transmission. The west zone is a downtown area where streets are densely inhabited and where people regularly throw food into the streets. The accessibility of food in the garbage not only augments fertility in dogs but also makes them more prone to attack humans whom they may view as competition for food.

## 5. Conclusion

Open garbage dumps are a public health problem and they have led to an increased stray dog population in Srinagar, Kashmir, and thus an increased incident of dog bites and rabies cases. We suggest that proper garbage control can help to curb the stray dog population in the area and thus reduce the incidence of rabies.
