Differential Equations Arising from the 3-Variable Hermite Polynomials and Computation of Their Zeros

Cheon Seoung Ryoo

Abstract

In this paper, we study differential equations arising from the generating functions of the 3-variable Hermite polynomials. We give explicit identities for the 3-variable Hermite polynomials. Finally, we investigate the zeros of the 3-variable Hermite polynomials by using computer.

Keywords: differential equations, heat equation, Hermite polynomials, the 3-variable Hermite polynomials, generating functions, complex zeros

1. Introduction

Many mathematicians have studied in the area of the Bernoulli numbers, Euler numbers, Genocchi numbers, and tangent numbers see [1–15]. The special polynomials of two variables provided new means of analysis for the solution of a wide class of differential equations often encountered in physical problems. Most of the special function of mathematical physics and their generalization have been suggested by physical problems.

In [1], the Hermite polynomials are given by the exponential generating function

$$\sum_{n=0}^{\infty} H_n(x) \frac{t^n}{n!} = e^{2xt - t^2}.$$

We can also have the generating function by using Cauchy's integral formula to write the Hermite polynomials as

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2} = \frac{n!}{2\pi i} \oint_C \frac{e^{2tx-t^2}}{t^{n+1}} dt$$

with the contour encircling the origin. It follows that the Hermite polynomials also satisfy the recurrence relation

$$H_{n+1}(x) = 2xH_n(x) - 2nH_{n-1}(x).$$

Further, the two variables Hermite Kampé de Fériet polynomials $H_n(x, y)$ defined by the generating function (see [3])

$$\sum_{n=0}^{\infty} H_n(x, y) \frac{t^n}{n!} = e^{xt+yt^2} \tag{1}$$

are the solution of heat equation

$$\frac{\partial}{\partial y} H_n(x, y) = \frac{\partial^2}{\partial x^2} H_n(x, y), \quad H_n(x, 0) = x^n.$$

We note that

$$H_n(2x, -1) = H_n(x).$$

The 3-variable Hermite polynomials $H_n(x, y, z)$ are introduced [4].

$$H_n(x, y, z) = n! \sum_{k=0}^{\left[\frac{n}{3}\right]} \frac{z^k H_{n-3k}(x, y)}{k!(n-3k)!}.$$

The differential equation and he generating function for $H_n(x, y, z)$ are given by

$$\left(3z \frac{\partial^3}{\partial x^3} + 2y \frac{\partial^2}{\partial x^2} + x \frac{\partial}{\partial x} - n \right) H_n(x, y, z) = 0$$

and

$$e^{xt+yt^2+zt^3} = \sum_{n=0}^{\infty} H_n(x, y, z) \frac{t^n}{n!}, \tag{2}$$

respectively.

By (2), we get

$$\sum_{n=0}^{\infty} H_n(x_1 + x_2, y, z) \frac{t^n}{n!} = e^{(x_1+x_2)t+yt^2+zt^3}$$

$$= \sum_{n=0}^{\infty} x_2^n \frac{t^n}{n!} \sum_{n=0}^{\infty} H_n(x_1, y, z) \frac{t^n}{n!} \tag{3}$$

$$= \sum_{n=0}^{\infty} \left(\sum_{l=0}^{n} \binom{n}{l} H_l(x_1, y, z) x_2^{n-l} \right) \frac{t^n}{n!}.$$

By comparing the coefficients on both sides of (3), we have the following theorem.

Theorem 1. For any positive integer n, we have

$$H_n(x_1 + x_2, y, z) = \sum_{l=0}^{n} \binom{n}{l} H_l(x_1, y, z) x_2^{n-l}.$$

Applying Eq. (2), we obtain

$$\sum_{n=0}^{\infty} H_n(x, y, z_1 + z_2) \frac{t^n}{n!} = e^{xt + yt^2 + (z_1 + z_2)t^3}$$

$$= \sum_{k=0}^{\infty} z_2^n \frac{t^{3k}}{k!} \sum_{l=0}^{\infty} H_l(x, y, z_1) \frac{t^l}{l!}$$

$$= \sum_{n=0}^{\infty} \left(\sum_{k=0}^{\left[\frac{n}{3}\right]} \frac{H_{n-3k}(x, y, z_1) z_2^k n!}{k!(n-3k)!} \cdot \right) \frac{t^n}{n!}.$$

On equating the coefficients of the like power of t in the above, we obtain the following theorem.

Theorem 2. For any positive integer n, we have

$$H_n(x, y, z_1 + z_2) = n! \sum_{k=0}^{\left[\frac{n}{3}\right]} \frac{H_{n-3k}(x, y, z_1) z_2^k}{k!(n-3k)!}.$$

Also, the 3-variable Hermite polynomials $H_n(x, y, z)$ satisfy the following relations

$$\frac{\partial}{\partial y} H_n(x, y, z) = \frac{\partial^2}{\partial x^2} H_n(x, y, z),$$

and

$$\frac{\partial}{\partial z} H_n(x, y, z) = \frac{\partial^3}{\partial x^3} H_n(x, y, z).$$

The following elementary properties of the 3-variable Hermite polynomials $H_n(x, y, z)$ are readily derived form (2). We, therefore, choose to omit the details involved.

Theorem 3. For any positive integer n, we have

1    $H_n(2x, -1, 0) = H_n(x).$

2    $H_n(x, y_1 + y_2, z) = n! \sum_{k=0}^{\left[\frac{n}{2}\right]} \frac{H_{n-2k}(x, y_1, z) y_2^k}{k!(n-2k)!}.$

3    $H_n(x, y, z) = \sum_{l=0}^{n} \binom{n}{l} H_l(x) H_{n-l}(-x, y+1, z).$

Theorem 4. For any positive integer n, we have

1 $H_n(x_1 + x_2, y_1 + y_2, z) = \sum\limits_{l=0}^{n} \binom{n}{l} H_l(x_1, y_1, z) H_{n-l}(x_2, y_2).$

2 $H_n(x_1 + x_2, y_1 + y_2, z_1 + z_2) = \sum\limits_{l=0}^{n} \binom{n}{l} H_l(x_1, y_1, z) H_{n-l}(x_2, y_2, z_2).$

The 3-variable Hermite polynomials can be determined explicitly. A few of them are

$H_0(x, y, z) = 1,$
$H_1(x, y, z) = x,$
$H_2(x, y, z) = x^2 + 2y,$
$H_3(x, y, z) = x^3 + 6xy + 6z,$
$H_4(x, y, z) = x^4 + 12x^2y + 12y^2 + 24xz,$
$H_5(x, y, z) = x^5 + 20x^3y + 60xy^2 + 60x^2z + 120yz,$
$H_6(x, y, z) = x^6 + 30x^4y + 180x^2y^2 + 120y^3 + 120x^3z + 720xyz + 360z^2,$
$H_7(x, y, z) = x^7 + 42x^5y + 420x^3y^2 + 840xy^3 + 210x^4z + 2520x^2yz + 2520y^2z + 2520xz^2,$
$H_8(x, y, z) = x^8 + 56x^6y + 840x^4y^2 + 3360x^2y^3 + 1680y^4 + 336x^5z + 6720x^3yz$
$\qquad\qquad + 20160xy^2z + 10080x^2z^2 + 20160yz^2.$
$H_9(x, y, z) = x^9 + 72x^7y + 1512x^5y^2 + 10080x^3y^3 + 15120xy^4 + 504x^6z + 15120x^4yz$
$\qquad\qquad + 90720x^2y^2z + 60480y^3z + 30240x^3z^2 + 181440xyz^2 + 60480z^3,$
$H_{10}(x, y, z) = x^{10} + 90x^8y + 2520x^6y^2 + 25200x^4y^3 + 75600x^2y^4 + 30240y^5 + 720x^7z$
$\qquad\qquad + 30240x^5yz + 302400x^3y^2z + 604800xy^3z + 75600x^4z^2$
$\qquad\qquad + 907200x^2yz^2 + 907200y^2z^2 + 604800xz^3.$

Recently, many mathematicians have studied the differential equations arising from the generating functions of special polynomials (see [7, 8, 12, 16–19]). In this paper, we study differential equations arising from the generating functions of the 3-variable Hermite polynomials. We give explicit identities for the 3-variable Hermite polynomials. In addition, we investigate the zeros of the 3-variable Hermite polynomials using numerical methods. Using computer, a realistic study for the zeros of the 3-variable Hermite polynomials is very interesting. Finally, we observe an interesting phenomenon of 'scattering' of the zeros of the 3-variable Hermite polynomials.

2. Differential equations associated with the 3-variable Hermite polynomials

In this section, we study differential equations arising from the generating functions of the 3-variable Hermite polynomials.

Let

$$F = F(t, x, y, z) = e^{xt + yt^2 + zt^3} = \sum_{n=0}^{\infty} H_n(x, y, z) \frac{t^n}{n!}, \quad x, y, z, t \in \mathbb{C}. \qquad (4)$$

Then, by (4), we have

$$F^{(1)} = \frac{\partial}{\partial t} F(t, x, y, z) = \frac{\partial}{\partial t} \left(e^{xt+yt^2+zt^3} \right) = e^{xt+yt^2+zt^3} \left(x + 2yt + 3zt^2 \right)$$

$$= \left(x + 2yt + 3zt^2 \right) F(t, x, y, z),$$

(5)

$$F^{(2)} = \frac{\partial}{\partial t} F^{(1)}(t, x, y, z) = (2y + 6zt)F(t, x, y, z) + \left(x + 2yt + 3zt^2 \right) F^{(1)}(t, x, y, z)$$

$$= \left((x^2 + 2y) + (6z + 4xy)t + (4y^2 + 6xz)t^2 + (12yz)t^3 + (9z^2)t^4 \right) F(t, x, y, z).$$

(6)

Continuing this process, we can guess that

$$F^{(N)} = \left(\frac{\partial}{\partial t} \right)^N F(t, x, y, z) = \sum_{i=0}^{2N} a_i(N, x, y, z) t^i F(t, x, y, z), \ (N = 0, 1, 2, \ldots).$$

(7)

Differentiating (7) with respect to t, we have

$$F^{(N+1)} = \frac{\partial F^{(N)}}{\partial t} = \sum_{i=0}^{2N} a_i(N, x, y, z) i t^{i-1} F(t, x, y, z) + \sum_{i=0}^{2N} a_i(N, x, y, z) t^i F^{(1)}(t, x, y, z)$$

$$= \sum_{i=0}^{2N} a_i(N, x, y, z) i t^{i-1} F(t, x, y, z) + \sum_{i=0}^{2N} a_i(N, x, y, z) t^i \left(x + 2yt + 3zt^2 \right) F(t, x, y, z)$$

$$= \sum_{i=0}^{2N} i a_i(N, x, y, z) t^{i-1} F(t, x, y, z) + \sum_{i=0}^{2N} x a_i(N, x, y, z) t^i F(t, x, y, z)$$

$$+ \sum_{i=0}^{2N} 2y a_i(N, x, y, z) t^{i+1} F(t, x, y, z) + \sum_{i=0}^{2N} 3z a_i(N, x, y, z) t^{i+2} F(t, x, y, z)$$

$$= \sum_{i=0}^{2N-1} (i + 1) a_{i+1}(N, x, y, z) t^i F(t, x, y, z) + \sum_{i=0}^{2N} x a_i(N, x, y, z) t^i F(t, x, y, z)$$

$$+ \sum_{i=1}^{2N+1} 2y a_{i-1}(N, x, y, z) t^i F(t, x, y, z) + \sum_{i=2}^{2N+2} 3z a_{i-2}(N, x, y, z) t^i F(t, x, y, z)$$

Hence we have

$$F^{(N+1)} = \sum_{i=0}^{2N-1} (i + 1) a_{i+1}(N, x, y, z) t^i F(t, x, y, z)$$

$$+ \sum_{i=0}^{2N} x a_i(N, x, y, z) t^i F(t, x, y, z)$$

$$+ \sum_{i=1}^{2N+1} 2y a_{i-1}(N, x, y, z) t^i F(t, x, y, z)$$

$$+ \sum_{i=2}^{2N+2} 3z a_{i-2}(N, x, y, z) t^i F(t, x, y, z).$$

(8)

Now replacing N by $N+1$ in (7), we find

$$F^{(N+1)} = \sum_{i=0}^{2N+2} a_i(N+1,x,y,z)t^i F(t,x,y,z).$$ (9)

Comparing the coefficients on both sides of (8) and (9), we obtain

$$a_0(N+1,x,y,z) = a_1(N,x,y,z) + xa_0(N,x,y,z),$$
$$a_1(N+1,x,y,z) = 2a_2(N,x,y,z) + xa_1(N,x,y,z) + 2ya_0(N,x,y,z),$$
$$a_{2N}(N+1,x,y,z) = xa_{2N}(N,x,y,z) + 2ya_{2N-1}(N,x,y,z) + 3za_{2N-2}(N,x,y,z),$$ (10)
$$a_{2N+1}(N+1,x,y,z) = 2ya_{2N}(N,x,y,z) + 3za_{2N-1}(N,x,y,z),$$
$$a_{2N+2}(N+1,x,y,z) = 3za_{2N}(N,x,y,z),$$

and

$$a_i(N+1,x,y,z) = (i+1)a_{i+1}(N,x,y,z) + xa_i(N,x,y,z)$$
$$+ 2ya_{i-1}(N,x,y,z) + 3za_{i-2}(N,x,y,z), \, (2 \leq i \leq 2N-1).$$ (11)

In addition, by (7), we have

$$F(t,x,y,z) = F^{(0)}(t,x,y,z) = a_0(0,x,y,z)F(t,x,y,z),$$ (12)

which gives

$$a_0(0,x,y,z) = 1.$$ (13)

It is not difficult to show that

$$xF(t,x,y) + 2ytF(t,x,y,z) + 3zt^2F(t,x,y,z)$$
$$= F^{(1)}(t,x,y,z)$$
$$= \sum_{i=0}^{2} a_i(1,x,y,z)F(t,x,y,z)$$ (14)
$$= \big(a_0(1,x,y,z) + a_1(1,x,y,z)t + a_2(1,x,y,z)t^2\big)F(t,x,y,z).$$

Thus, by (14), we also find

$$a_0(1,x,y,z) = x, \quad a_1(1,x,y,z) = 2y, \quad a_2(1,x,y,z) = 3z.$$ (15)

From (10), we note that

$$a_0(N+1,x,y,z) = a_1(N,x,y,z) + xa_0(N,x,y,z),$$
$$a_0(N,x,y,z) = a_1(N-1,x,y,z) + xa_0(N-1,x,y,z), \, \ldots$$
$$a_0(N+1,x,y,z) = \sum_{i=0}^{N} x^i a_1(N-i,x,y,z) + x^{N+1},$$ (16)

and

$$a_{2N+2}(N+1,x,y,z) = 3za_{2N}(N,x,y,z),$$
$$a_{2N}(N,x,y,z) = 3za_{2N-2}(N-1,x,y,z), \ldots \qquad (17)$$
$$a_{2N+2}(N+1,x,y,z) = (3z)^{N+1}.$$

Note that, here the matrix $a_i(j,x,y)_{0\le i\le 2N+2, 0\le j\le N+1}$ is given by

$$
\begin{pmatrix}
1 & x & 2y+x^2 & \cdot & \cdots & \cdot \\
0 & 2y & 4xy+6z & \cdot & \cdots & \cdot \\
0 & 3z & 6xz+4y^2 & \cdot & \cdots & \cdot \\
0 & 0 & 12yz & \cdot & \cdots & \cdot \\
0 & 0 & (3z)^2 & \cdot & \cdots & \cdot \\
0 & 0 & 0 & \cdot & \cdots & \cdot \\
0 & 0 & 0 & (3z)^3 & \cdots & \cdot \\
\vdots & \vdots & \vdots & \vdots & \ddots & \cdot \\
0 & 0 & 0 & 0 & \cdots & (3z)^{N+1}
\end{pmatrix}
$$

Therefore, we obtain the following theorem.

Theorem 5. For $N = 0, 1, 2, \ldots,$ the differential equation

$$F^{(N)} = \left(\frac{\partial}{\partial t}\right)^N F(t,x,y,z) = \left(\sum_{i=0}^{N} a_i(N,x,y,z)t^i\right) F(t,x,y,z)$$

has a solution

$$F = F(t,x,y,z) = e^{xt+yt^2+zt^3},$$

where

$$a_0(N+1,x,y,z) = \sum_{i=0}^{N} x^i a_1(N-i,x,y,z) + x^{N+1},$$
$$a_1(N+1,x,y,z) = 2a_2(N,x,y,z) + xa_1(N,x,y,z) + 2ya_0(N,x,y,z),$$
$$a_{2N}(N+1,x,y,z) = xa_{2N}(N,x,y,z) + 2ya_{2N-1}(N,x,y,z) + 3za_{2N-2}(N,x,y,z),$$
$$a_{2N+1}(N+1,x,y,z) = 2ya_{2N}(N,x,y,z) + 3za_{2N-1}(N,x,y,z),$$
$$a_{2N+2}(N+1,x,y,z) = (3z)^{N+1},$$

and

$$a_i(N+1, x, y, z) = (i+1)a_{i+1}(N, x, y, z) + xa_i(N, x, y, z)$$
$$+ 2ya_{i-1}(N, x, y, z) + 3za_{i-2}(N, x, y, z), \, (2 \leq i \leq 2N-1).$$

From (4), we note that

$$F^{(N)} = \left(\frac{\partial}{\partial t}\right)^N F(t, x, y, z) = \sum_{k=0}^{\infty} H_{k+N}(x, y, z)\frac{t^k}{k!}. \tag{18}$$

By (4) and (18), we get

$$e^{-nt}\left(\frac{\partial}{\partial t}\right)^N F(t, x, y, z) = \left(\sum_{m=0}^{\infty}(-n)^m \frac{t^m}{m!}\right)\left(\sum_{m=0}^{\infty} H_{m+N}(x, y, z)\frac{t^m}{m!}\right)$$

$$= \sum_{m=0}^{\infty}\left(\sum_{k=0}^{m}\binom{m}{k}(-n)^{m-k}H_{N+k}(x, y, z)\right)\frac{t^m}{m!}. \tag{19}$$

By the Leibniz rule and the inverse relation, we have

$$e^{-nt}\left(\frac{\partial}{\partial t}\right)^N F(t, x, y, z) = \sum_{k=0}^{N}\binom{N}{k}n^{N-k}\left(\frac{\partial}{\partial t}\right)^k \left(e^{-nt}F(t, x, y, z)\right)$$

$$= \sum_{m=0}^{\infty}\left(\sum_{k=0}^{N}\binom{N}{k}n^{N-k}H_{m+k}(x-n, y, z)\right)\frac{t^m}{m!}. \tag{20}$$

Hence, by (19) and (20), and comparing the coefficients of $\frac{t^m}{m!}$ gives the following theorem.

Theorem 6. Let m, n, N be nonnegative integers. Then

$$\sum_{k=0}^{m}\binom{m}{k}(-n)^{m-k}H_{N+k}(x, y, z) = \sum_{k=0}^{N}\binom{N}{k}n^{N-k}H_{m+k}(x-n, y, z). \tag{21}$$

If we take $m = 0$ in (21), then we have the following corollary.

Corollary 7. For $N = 0, 1, 2, \ldots,$ we have

$$H_N(x, y, z) = \sum_{k=0}^{N}\binom{N}{k}n^{N-k}H_k(x-n, y, z).$$

For $N = 0, 1, 2, \ldots,$ the differential equation

$$F^{(N)} = \left(\frac{\partial}{\partial t}\right)^N F(t, x, y, z) = \left(\sum_{i=0}^{N} a_i(N, x, y, z)t^i\right)F(t, x, y, z)$$

has a solution

$$F = F(t, x, y, z) = e^{xt + yt^2 + zt^3}.$$

Here is a plot of the surface for this solution. In **Figure 1(left)**, we choose $-2 \leq z \leq 2$, $-1 \leq t \leq 1$, $x = 2$, and $y = -4$. In **Figure 1(right)**, we choose $-5 \leq x \leq 5$, $-1 \leq t \leq 1$, $y = -3$, and $z = -1$.

3. Distribution of zeros of the 3-variable Hermite polynomials

This section aims to demonstrate the benefit of using numerical investigation to support theoretical prediction and to discover new interesting pattern of the zeros of the 3-variable Hermite polynomials $H_n(x, y, z)$. By using computer, the 3-variable Hermite polynomials $H_n(x, y, z)$ can be determined explicitly. We display the shapes of the 3-variable Hermite polynomials $H_n(x, y, z)$ and investigate the zeros of the 3-variable Hermite polynomials $H_n(x, y, z)$. We investigate the beautiful zeros of the 3-variable Hermite polynomials $H_n(x, y, z)$ by using a computer. We plot the zeros of the $H_n(x, y, z)$ for $n = 20$, $y = 1$, -1, $1 + i$, $-1 - i$, $z = 3$, $-3, 3 + i$, $-3 - i$ and $x \in \mathbb{C}$ (**Figure 2**). In **Figure 2(top-left)**, we choose $n = 20$, $y = 1$, and $z = 3$. In **Figure 2(top-right)**, we choose $n = 20$, $y = -1$, and $z = -3$. In **Figure 2(bottom-left)**, we choose $n = 20$, $y = 1 + i$, and $z = 3 + i$. In **Figure 2(bottom-right)**, we choose $n = 20$, $y = -1 - i$, and $z = -3 - i$.

In **Figure 3(top-left)**, we choose $n = 20$, $x = 1$, and $y = 1$. In **Figure 3(top-right)**, we choose $n = 20$, $x = -1$, and $y = -1$. In **Figure 3(bottom-left)**, we choose $n = 20$, $x = 1 + i$, and $y = 1 + i$. In **Figure 3(bottom-right)**, we choose $n = 20$, $x = -1 - i$, and $y = -1 - i$.

Stacks of zeros of the 3-variable Hermite polynomials $H_n(x, y, z)$ for $1 \leq n \leq 20$ from a 3-D structure are presented (**Figure 3**). In **Figure 4(top-left)**, we choose $n = 20$, $y = 1$, and $z = 3$. In **Figure 4(top-right)**, we choose $n = 20$, $y = -1$, and $z = -3$. In **Figure 4(bottom-left)**, we choose $n = 20$, $y = 1 + i$, and $z = 3 + i$. In **Figure 4(bottom-right)**, we choose $n = 20$, $y = -1 - i$, and $z = -3 - i$.

**Figure 1.** The surface for the solution $F(t, x, y, z)$.

Figure 2. Zeros of $H_n(x, y, z)$.

Our numerical results for approximate solutions of real zeros of the 3-variable Hermite polynomials $H_n(x, y, z)$ are displayed (**Tables 1–3**).

The plot of real zeros of the 3-variable Hermite polynomials $H_n(x, y, z)$ for $1 \leq n \leq 20$ structure are presented (**Figure 5**).

In **Figure 5(left)**, we choose $y = 1$ and $z = 3$. In **Figure 5(right)**, we choose $y = -1$ and $z = -3$.

Stacks of zeros of $H_n(x, -2, 4)$ for $1 \leq n \leq 40$, forming a 3D structure are presented (**Figure 6**). In **Figure 6(top-left)**, we plot stacks of zeros of $H_n(x, -2, 4)$ for $1 \leq n \leq 20$. In **Figure 6(top-right)**, we draw x and y axes but no z axis in three dimensions. In **Figure 6(bottom-left)**, we draw y
Figure 3. Zeros of $H_n(x, y, z)$.

and z axes but no x axis in three dimensions. In **Figure 6(bottom-right)**, we draw x and z axes but no y axis in three dimensions.

It is expected that $H_n(x, y, z), x \in \mathbb{C}, y, z \in \mathbb{R}$, has $\mathrm{Im}(x) = 0$ reflection symmetry analytic complex functions (see **Figures 2–7**). We observe a remarkable regular structure of the complex roots of the 3-variable Hermite polynomials $H_n(x, y, z)$ for $y, z \in \mathbb{R}$. We also hope to verify a remarkable regular structure of the complex roots of the 3-variable Hermite polynomials $H_n(x, y, z)$ for $y, z \in \mathbb{R}$ (**Tables 1** and **2**). Next, we calculated an approximate solution satisfying $H_n(x, y, z) = 0, x \in \mathbb{C}$. The results are given in **Tables 3** and **4**.
Figure 4. Stacks of zeros of $H_n(x,y,z)$, $1 \le n \le 20$.

The plot of real zeros of the 3-variable Hermite polynomials $H_n(x,y,z)$ for $1 \le n \le 20$ structure are presented (**Figure 7**).

In **Figure 7(left)**, we choose $x = 1$ and $y = 2$. In **Figure 7(right)**, we choose $x = -1$ and $y = -2$.

Finally, we consider the more general problems. How many zeros does $H_n(x,y,z)$ have? We are not able to decide if $H_n(x,y,z) = 0$ has n distinct solutions. We would also like to know the number of complex zeros $C_{H_n(x,y,z)}$ of $H_n(x,y,z)$, $\text{Im}(x) \ne 0$. Since n is the degree of the polynomial $H_n(x,y,z)$, the number of real zeros $R_{H_n(x,y,z)}$ lying on the real line $\text{Im}(x) = 0$ is then $R_{H_n(x,y,z)} = n - C_{H_n(x,y,z)}$, where $C_{H_n(x,y,z)}$ denotes complex zeros. See **Tables 1** and **2** for

Degree n	Real zeros	Complex zeros
1	1	0
2	0	2
3	1	2
4	2	2
5	1	4
6	2	4
7	3	4
8	2	6

tabulated values of $R_{H_n(x,y,z)}$ and $C_{H_n(x,y,z)}$. The author has no doubt that investigations along these lines will lead to a new approach employing numerical method in the research field of the 3-variable Hermite polynomials $H_n(x, y, z)$ which appear in mathematics and physics. The reader may refer to [2, 11, 13, 20] for the details.
