

# PROGNOSTIC FACTORS IN ADVANCED DISEASE HOW TO SUPPORT DECISION-MAKING

Filipa Ferreira, José Pereira, Leonor Fernandes, Ana João Pissarra, Joana Graça, Leonor Matos, José Nunes Marques, Ana Martins Medical Oncology Department of Hospital São Francisco Xavier – Centro Hospitalar de Lisboa Ocidental Lisbon, Portugal

#### INTRODUCTION

In Oncology, it is essential to recognize the end-of-life period as its identification changes the decisions towards the treatment and overall management of the patient. However, there is lack of validated prognostic scales to help with this identification. Clinical prediction of survival (CPS), performance status (PS), several signs/symptoms (such as weight loss, anorexia, dysphagia, xerostomia, dyspnea and delirium) and analytic factors (leukocytosis, lymphocytopenia and C-reactive protein) showed prognostic value in several studies. Two validated scores also showed prognostic value: Palliative Prognostic Score (PPS) and Palliative Prognostic Index (PPI).

#### **OBJECTIVES**

Identification of prognostic factors in end-stage disease for prediction of survival and to support the decision to initiate specific oncologic treatment.

#### **METHODS**

Retrospective observational study including the patients admitted in a Portuguese Oncology department for one year (during 2016), evaluation of patient/disease characteristics and aferition of possible prognostic factors. PPS and PPI were also calculated. The data were collected from the patients' clinical processes in January 2018. The statistic analysis was preformed using correlation coefficient calculation in Excel and SPSS programs.

#### RESULTS

The prognostic value of various factors mentioned in literature was evaluated in this population:

	Evaluated factors	Mean	Correlation coeficient with survival	
Age (years)		71.41	-0.25 <u>(p=0.008)</u>	
Performance st	atus (ECOG)	0.86	-0.52 <u>(p&lt;0.001)</u>	
Number of com	orbidities	2.57	-0.22 (p= <u>0.020)</u>	
Previous medic	ation (number of drugs)	4.15	-0.17 (p=0.074)	
Number of met	astatic sites	1.32	-0.09 (p=0.350)	
<b>Symptomatic burden</b> (number of symptoms: weight loss, anorexia, dysphagia, nausea/vomiting, dyspnea, anxiety, pain and delirium)		1.23	-0.24 (p= <u>0.011)</u>	Statistically significant per se anorexia (R 0.23)
<b>Analytic alterations</b> (number of alterations: anemia, leukocytosis, lymphocytopenia, decreased creatinine clearance, hypoalbuminemia, hyperbilirubinemia, high Lactate dehydrogenase and high C-reactive protein)		2.21	-0.26 (p= <u>0.006)</u>	Statistically significant per so decreased creatinine clearand (R -0.22), hypoalbuminemia ( -0.36), LDH (R -0.20) and hig C-reactive protein (R -0.26)
Clinical prediction of survival (<12 weeks vs. ≥12 weeks)		-	0.28 (p= <u>0.033)</u>	
	symptomatic burden, anal	ytic alter	ations and CPS Correlat	ion coefficient
			WIL	
	Palliative Prognostic Score (Dyspnea, Anorexia, Karnofsky per prediction of survival, Total WBC count, Lymphocyte percenta	rformance s Ige)	tatus, Clinical -0.3	7 (p <u>&lt;0.001)</u>
	Palliative Prognostic Score (Dyspnea, Anorexia, Karnofsky per prediction of survival, Total WBC count, Lymphocyte percenta Palliative Prognostic Index (PPS, Oral intake, edema, dyspnea	rformance s age) 1 at rest, del	tatus, Clinical -0.3 irium) -0.44	7 (p <u>&lt;0.001)</u> 4 (p <u>&lt;0.001)</u>
<ul> <li>AORE NUMB</li> <li>38% of the in this per</li> </ul>	Palliative Prognostic Score (Dyspnea, Anorexia, Karnofsky per prediction of survival, Total WBC count, Lymphocyte percenta Palliative Prognostic Index (PPS, Oral intake, edema, dyspnea ERS: e patients died in the 6 months after the first app	rformance s age) a at rest, del ointment	rtatus, Clinical -0.3 irium) -0.4 :: only 9 of them being	submitted to chemother

## with metastatic (79.3%) or locally advanced/irresectable (20.7%) disease

**Primary tumors:** 

### CONCLUSION

With the limitations of a retrospective study, in this analysis the authors confirm the importance of several validated factors and scores in predicting the survival in this population. PS and CPS showed to be the most relevant prognostic factors, as they also were in several published studies. The correlation coefficients are indeed quite low (mostly inferior to  $\pm 0.5$ ), but similar to those in other studies (e.g. CPS between 0.2 and 0.65).

It seems essential to highlight the importance of clinicians prediction as one of the most determinant factors in end-of-life decisions. The search for ways of help decision making in this period is essential, as the failure to do it can have important clinical, psychologic, economic and moral implications.
